mib:EET 2.0

A modern cloud solution for electronic registration of sales on SAP

From 1 January 2027, new legislation takes effect governing the registration of sales paid on the spot in cash, by card or by QR code. For companies covered by this legislation, it means ensuring a reliable, legally accurate and high-performance connection between their systems and the new REST API interface of the state administration.

For organisations running SAP ERP systems, we bring a proven, technologically advanced cloud application: mib:EET 2.0. It builds on the highly successful 2017 version, fully modernises it for 2027 standards and reduces both administrative and technical workload.

Key benefits of mib:EET 2.0

- **Full SAP integration without disrupting processes**
  The application is transported and configured directly in your SAP environment (ECC or S/4HANA). Your employees keep working in a familiar interface, and invoicing and payment processes run without any delay.
- **Cloud-ready architecture (SaaS)**
  The application uses a modern cloud component for orchestration and communication with the Ministry of Finance. It requires no complex local installation or demanding hardware maintenance.
- **Guaranteed legislative compliance for EET 2.0**
  mib:EET 2.0 fully supports the new REST API protocol and the optimised (smaller) data set, and reflects legislative changes (e.g. receipts are now printed only at the customer's request).
- **Robust and resilient to outages**
  If the internet or the state administration's servers go down, the application automatically switches to offline mode. Once the connection is restored, it sends any pending transactions in the background on its own.
- **Modular, tailor-made design**
  Every large company has its own specifics. mib:EET 2.0 is therefore designed to be flexibly configured and extended to match the exact needs of each organisation and its internal processes.
- **A solution for all payment types**
  mib:EET 2.0 covers all standard and advanced financial and sales flows directly in SAP.

How mib:EET 2.0 works

1. Transaction created in SAP
As soon as a document subject to sales registration is posted or printed in SAP, the system automatically identifies it as a registered sale.

2. Automatic data preparation
mib:EET 2.0 instantly reads the required data (identification of the business premises and cash register, tax ID and amounts) and builds a data message in the new REST API format required by law. It all takes a fraction of a second and needs no user action.

3. Fast and secure communication via the cloud
The prepared message is encrypted with the organisation's security certificate and sent to the servers of the Czech Ministry of Finance. The cloud solution ensures maximum throughput and stability even under heavy load (e.g. pre-Christmas sales).

4. Instant response and optional printing
The Financial Administration's servers process the transaction and immediately return a unique Fiscal Identification Code (FIK). It is written to the document in SAP straight away and, if the customer requests it, printed on the receipt or invoice. The whole process, from saving the document to printing, takes less than 2 seconds.

Monitoring and administration

mib:EET 2.0 offers a clear set of monitoring tools:

Transaction monitor (EET Dashboard)
A single central place in SAP showing the status of all sent sales (successfully sent, data error, offline processing, duplicates).

Automatic e-mail alerts
If the system detects a transaction that was not sent due to a user-side error (e.g. missing master data), it automatically sends an e-mail alert to the responsible user group.

Easy transport of settings
A dedicated transaction lets you easily move the entire configuration of business premises, cash registers and tax codes between test and production SAP systems.

Smooth implementation and compatibility

mib:EET 2.0 is designed to minimise the impact on the customer's IT infrastructure:

Compatibility
Fully ready for SAP ECC / SAP R/3, SAP S/4HANA On-Premise and SAP S/4HANA Cloud Private Edition.

Security
Encrypted communication, certificate management directly in SAP's secure store (STRUST) and full transparency of the transmitted data.
